

PETRA DESIGN

Natural Colour Variation Statement

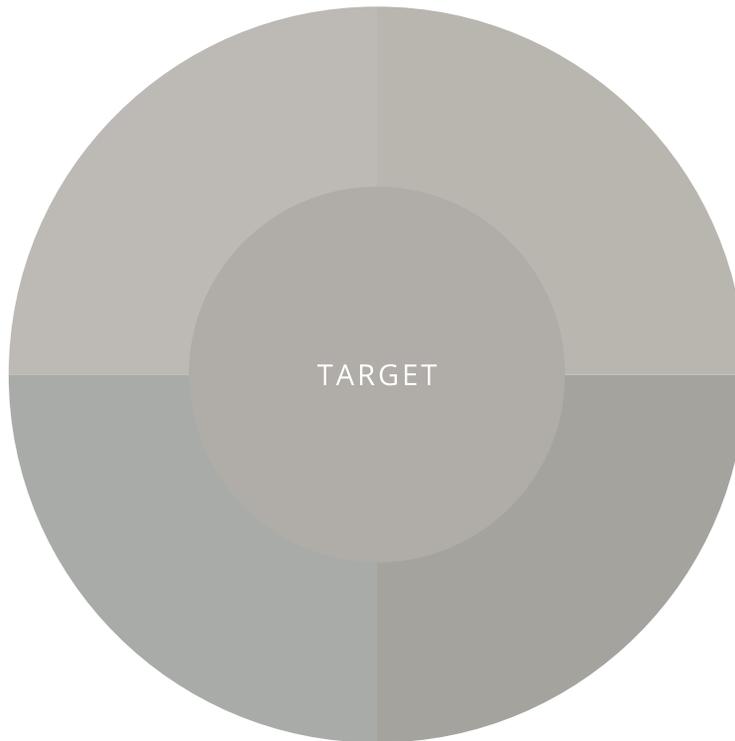

Petra Design's precast concrete, GFRC (Glass Fiber Reinforced Concrete), and UHPC (Ultra High-Performance Concrete) are natural, mineral-based products that may exhibit subtle color variations between pieces. Our standard grey color, like all mineral-based materials, has inherent variation due to raw materials and production processes. The grid below illustrates potential color variations within acceptable tolerance. Please note, printed or digital representations are not exact matches to physical samples.

Petra Design employs a series of quality control measures to minimize color variation within and between production lots, including:

- Careful selection and control of premium cements, pigments, and aggregates
- Rigorous quality checks on raw materials, including color monitoring and gradation testing
- Automated batching and mixing procedures to ensure consistency and homogeneity
- Controlled curing environments to reduce variability

Note: For projects where uniformity is preferred, Petra Design offers factory-applied finishing options designed to create a more consistent appearance within and across panels while maintaining long-term durability.

As the authority for approval and acceptance of Petra Design products for this project, I accept the potential natural color range represented above.
